

ABSTRACT OF THE DISCLOSURE

5 A child position monitoring system for providing a warning to
a user that a child being monitored has or is moving. The child
position monitoring system includes a motion detection assembly
detects when the child rolls over, the motion detection assembly
includes a transmitter assembly for sending a signal associated with
10 motion detected; a coupling assembly is used for coupling the
motion detection assembly to the child; and a monitoring assembly
operationally interacting with the motion detection assembly and
providing an indication associated with motion detected by the
motion detection assembly to the user.
